Tropical Products: World Markets and Trade

Coffee: 2008/09 Forecast Overview

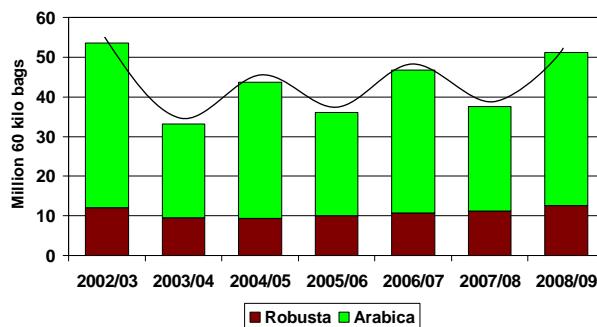

- **World coffee production forecast to hit record 140.6 million bags**

World coffee production is forecast at 140.6 million bags (60 kilograms or 132.276 pounds), up 18.2 million bags from the previous year. Brazil and Vietnam are forecast to produce 51.1 million bags and 21.5 million bags, respectively, accounting for 17.5 million bags of the year-over-year increase.

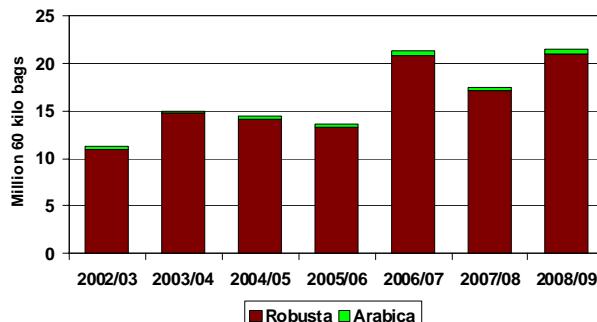

Brazil: Production is expected to jump 36 percent to 51.1 million bags, mainly due to entering the on-year of the biennial cycle of Arabica trees. With 75 percent of the harvest coming from Arabica trees, output is largely determined by this on-year off-year cycle. The forecast harvest is expected to be the country's second-largest behind the 2002/03 crop of 53.6 million bags. Dry weather that prevailed in August and September 2007 partially offset initial prospects for a better crop. However, steady rains from October 2007 through April 2008 supported stable fruit setting and cherry development. The expected rise in production is also supported by improved prices throughout 2007, especially for Robusta coffee, which provided an incentive for better crop management and higher input utilization.

Vietnam: Production is forecast to climb 23 percent to 21.5 million bags primarily on expectations of favorable weather. Last year's crop was damaged by heavy rains in several key planting areas as well as unseasonable frost in the Lam Dong province. Because production is overwhelmingly Robusta, output is primarily determined by weather versus a biennial cycle related to Arabica trees. Utilization of inputs such as irrigation, pesticides and fertilizer also heavily influence production.

Brazil's Production Largely Determined by Biennial Cycle of Arabica Trees

Vietnam's Production is Dominated by Robusta Trees and is Influenced More by Adverse Weather and Crop Expansion

Majority of Arabica is from Brazil, Colombia and Central America, while Robusta is Grown Primarily in Vietnam, Brazil and Indonesia

- Producers and importers forecast to rebuild ending stocks but supplies to remain tight

Ending stocks in producing and importing countries are forecast to expand 6.7 million bags to total 39.2 million bags, with producers holding 17.2 million bags and importers carrying 22.0 million bags. Data revisions for Brazil, Costa Rica, and India reduced last year's ending stocks figure for producers to 12.4 million bags, further deepening the lowest level of stocks recorded in the USDA database dating back to 1960/61. Because importing countries are not in the database, these data were compiled based on information from the European Coffee Federation, the International Coffee Organization (ICO), the U.S. Green Coffee Association, and the Japanese government.

Producer and Importer Ending Stocks Trending Down in Pattern Dominated by Brazil's Biennial Coffee Cycle

Since 2003/04, the combined ending stocks for producers and importers have been trending down in a pattern dominated by Brazil's biennial coffee cycle. Inventory levels will continue to draw considerable attention since Brazilian production is expected to enter the off-year of the biennial cycle in 2009/10. In the last six years, the difference between Brazil's on-year and off-year averaged 11.5 million bags.

- **Rising input costs combined with a weak U.S. dollar cut into profits**

Fertilizer costs have been growing over the last several years. Analysis of Brazil's import statistics indicates these costs increased 275 percent between January 2005 and April 2008, with skyrocketing costs in the last six months contributing to most of the run-up.

Labor costs have been on the rise over the last several years. The U.S. Bureau of Labor Statistics report "International Comparisons of Hourly Compensation Costs" indicates a trend suggesting that Brazil's labor costs have risen 30 percent since 2005. Although this survey extends beyond agriculture, it can be viewed as a proxy measure of rising labor costs for the world's largest coffee producing country. For producers with big plantations, labor is the most significant input cost.

Transportation costs have accelerated as a direct result of oil prices surging 190 percent between January 2005 and May 2008. Analysis of Brazil's transportation costs as reported by USDA's Agricultural Marketing Service illustrates this relationship between oil and transport costs. Between first quarter 2005 and 2008, Brazil's truck freight rate to the Port of Santos increased 120 percent while ocean freight rates from the port to Hamburg, Germany increased 58 percent.

Pesticide costs have also spiked recently. For example, the cost of spraying copper-based fungicides in Kenya tripled just in the last year.

The **weak U.S. dollar** has eliminated gains from rising coffee prices, because most coffee contracts are quoted in dollars. For example, the January 2005 price for Brazilian Natural Arabicas averaged \$0.94 per pound. Since the Brazilian exchange rate was R\$2.69 per U.S. dollar, this equated to R\$2.53 per pound. By May 2008, the average price was \$1.23 per pound. At an exchange rate of R\$1.66 per U.S. dollar, this equated to R\$2.08 per pound. So, even though coffee prices increased 31 percent, prices translated from U.S. dollars to Brazilian Reales decreased 18 percent.

Brazil's Fertilizer Costs Skyrocketed in the Last Few Months, Even as Coffee Prices Began to Fall

Depreciating U.S. Dollar Nets Brazilian Producers Less Despite Rise in Coffee Prices

- **Hurdles limit significant expansion expectations for one-third of world's producers**

Vietnam's Ministry of Agriculture and Rural Development issued a directive to provinces to halt the expansion of coffee growing areas until 2010 in order to address quality issues. Farmers are being encouraged to either replace old coffee trees or shift to other crops such as cocoa or cashew. Despite these efforts, coffee farmers continue to expand their production area in response to high coffee prices.

Ecuador does not have the capacity to raise production to a large extent in the near-term. Although Ecuador has started a tree re-planting program, a large portion of bearing trees have reached over 40 years of age and have low yields. Also, approximately 90 percent of the production is carried out using rudimentary techniques.

India's producers have started experiencing shortages of skilled labor, which could become a major problem in coming years. Mechanization in coffee plantations is difficult in India because of geographical constraints and uneven plantings.

Indonesia's government has encouraged farmers to replace coffee trees with cocoa by providing free seeds as well as subsidized five-year loans. The trend is not expected to continue following the elections in 2009, but swaps back to coffee are not anticipated in the near-term.

Kenya's producers have responded to price instability and high costs by inter-cropping with corn, beans and tree crops, resulting in lower yields and quality. Producers from the main coffee growing regions increasingly engage in more profitable enterprises such as horticulture and dairy.

Venezuela's coffee prices are controlled by the government and have not been adjusted for over three years. As a result, harvest area has not expanded during this time. Producers have requested a 50-percent upward revision to the price, but as of early May, the government had yet to respond.

Guatemala's producers continue to recover from Hurricane Stan in October 2005. Although prices have recovered in the last few years, they are not high enough to justify growth investment. Also, yields are not expected to climb due to high fertilizer costs and lower utilization.

- **Upward trend in prices marked by volatility from hedge and index funds**

Prices have followed a general upward trend since January 2005. The ICO coffee composite languished for several years between 40 and 60 U.S. cents per pound in response to high inventory levels. Prices in February and early March 2008 accelerated as speculator activity from hedge and index funds pushed prices up. However, prices in mid-March experienced a mini-crash as many of these funds reduced their exposure to coffee in order to cover margin calls for other investments in response to the global credit crunch.

- **Many countries implement programs to assist producers**

In **Brazil**, the long-established Coffee Defense Fund (FUNCAFE) has a current budget of R\$2.16 billion (\$1.33 billion), which will be used to finance harvesting, acquisitions, storage, and crop management. The **Colombian** government maintains a minimum price support program for coffee growers, which was increased 27 percent in 2007, and continues in its efforts to conduct a massive tree-renovation program. Also, the National Coffee Producer's Association (FEDECAFE) has been authorized to pay coffee farmers in the form of fertilizers. The **Kenyan** government recently eliminated \$160 million of producer debt and established a \$30 million development fund for affordable credit. In 2005, **El Salvador** implemented a \$40 million coffee recovery program that is still underway. **Guatemala**'s ANACAFE continues to manage a \$100 million coffee trust fund to finance low interest loans. **Mexico**'s government allocated \$86 million to the coffee sector in 2008. **India**'s Ministry of Commerce recently added coffee to its list of products eligible for the duty entitlement passbook scheme, a mechanism that reduces import duties for raw materials used to produce exported coffee.

- **Green coffee bean exports**

Exports are forecast to rise just 6 percent versus production expanding by 15 percent. Brazil's effort to boost ending inventories 5 million bags is the primary factor influencing different growth rates. World green coffee bean exports are forecast at 96.0 million bags, up 5.4 million bags from the previous year. Brazil and Vietnam are forecast to export 24.6 million bags and 20.5 million bags, respectively, accounting for 4.3 million bags of the year-over-year growth. These export figures exclude roast, ground, and soluble coffee. With Central American exports forecast at nearly the same level as the previous year, the remaining balance is spread over several Sub-Saharan African countries.

- **Green coffee bean imports**

In similar fashion, **imports** from select countries are forecast to increase 6 percent. Green coffee bean imports from select countries are forecast at 92.1 million bags, up 4.9 million bags from the previous year. These import figures exclude roast, ground, and soluble coffee. The European Union should import 46.6 million bags, or 2.6 million bags over the previous year, while U.S. imports are expected to expand 1.4 million bags to 22.5 million bags. Imports into Europe and the United States should strengthen based on efforts to rebuild inventory levels, supply domestic consumption, and expand exports of roasted and soluble coffee. Japan and Canada are forecast to import 6.8 million bags and 2.3 million bags, respectively.

1/ Coffee marketing year begins October in some countries and April or July in others. Attache reports were the basis for about 70 percent of the forecast total. Data provided by the International Coffee Organization and other sources supplement the balance.

2/ One bag - 132.276 pounds.

Note: The United States includes Puerto Rico and Hawaii.

Note: Production estimates for some countries include cross-border movements.
